Emergent neural computation from the interaction of different forms of plasticity Cristina Savin 2016-03-22
From the propagation of neural activity through synapses, to the integration of signals in the dendritic arbor, and the processes determining action potential generation, virtually all aspects of

neural processing are plastic. This plasticity underlies the remarkable versatility and robustness of cortical circuits: it enables the brain to learn regularities in its sensory inputs, to remember the past, and to recover function after injury. While much of the research into learning and memory has focused on forms of Hebbian plasticity at excitatory synapses (LTD/LTP, STDP), several other plasticity mechanisms have been characterized experimentally, including the plasticity of inhibitory circuits (Kullmann, 2012), synaptic scaling (Turrigiano, 2011) and intrinsic plasticity (Zhang and Linden, 2003). However, our current understanding of the computational roles of these plasticity mechanisms remains rudimentary at best. While

traditionally they are assumed to serve a homeostatic purpose, counterbalancing the destabilizing effects of Hebbian learning, recent work suggests that they can have a profound impact on circuit function (Savin 2010, Vogels 2011, Keck 2012). Hence, theoretical investigation into the functional implications of these mechanisms may shed new light on the computational principles at work in neural circuits. This Research Topic of Frontiers in Computational Neuroscience aims to bring together recent advances in theoretical modeling of different plasticity mechanisms and of their contributions to circuit function. Topics of interest include the computational roles of plasticity of inhibitory circuitry, metaplasticity, synaptic scaling, intrinsic plasticity,

plasticity within the dendritic arbor and in particular studies on the interplay between homeostatic and Hebbian plasticity, and their joint contribution to network function.

Brain Oscillations and Predictive Coding: What We Know and What We

Should Learn Roumen Kirov 2017-04-28

Predictive coding (PC) is a neurocognitive concept, according to which the brain does not process the whole qualia of external information, but only residual mismatches occurring between incoming information and an individual, inner model of the world. At the time of issue initiation, I expected an

essential focus on mismatch signals in the brain, especially those captured by neurophysiologic oscillations. This was because one most plausible approach to the PC concept is to identify and validate mismatch signals in the brain. Announcing the topic revealed a much deeper consideration of intelligible minds of researchers. It turned out that what was of fundamental interest was which brain mechanisms support the formation, maintenance and consolidation of the inner model determining PC. Is PC a dynamic construct continuously modulated by external environmental or internal mental information? The reader will be delighted to get acquainted with the current views and understanding of eminent scholars in the field. It will be challenging to discover the

realm of sleep where both physiological, energy preserving and mental qualia principles build on the inner models to shape and transform the self. And where neurophysiologic oscillations may both transmit external information and translate inner models from state to state to preserve the self-continuity and compactness.

Epilepsy and Intensive Care

Monitoring Bruce J Fisch, MD

2009-10-23 Unlike many other diagnostic procedures, EEG, now over 80 years old, and epilepsy monitoring, now over 40 years old, have demonstrated their usefulness and stood the test of time. Although the benefits of these diagnostic procedures are clear, monitoring is currently not available to the majority of patients in need. One of

the factors limiting broader implementation is the lack of practitioners with special expertise. Epilepsy and Intensive Care Monitoring was developed to address this concern. This practical volume contains detailed chapters covering all areas of clinical epilepsy monitoring. Featuring expert authors from major epilepsy centers, this seminal work reviews all current procedures and applications for monitoring adults and children with epilepsy in the Epilepsy Monitoring Unit and the ICU. Opening sections are devoted to indications, procedures, administrative considerations, and technical aspects of the Epilepsy Monitoring Unit and ICU monitoring, followed by dedicated sections on EEG diagnosis and localization and monitoring of

neurological disorders in the Epilepsy Monitoring Unit and ICU. The book concludes with special procedures and an Appendix with guidelines for organizing epilepsy monitoring centers and technical aspects of EEG monitoring. Key Features include Covers both adult and pediatric Epilepsy Monitoring Unit and ICU monitoring Contains over 235 high-quality EEGs and other illustrations, including an 8-page color section Comprehensive coverage; no other book in this area has comparable breadth and depth Clinical Focus Expert authors tell you when and how to perform the procedures they discuss

Advanced Analytics and Deep Learning Models Archana Mire 2022-05-03
Advanced Analytics and Deep Learning Models The book provides readers with an in-depth understanding of concepts and technologies related to the importance of analytics and deep learning in many useful real-world applications such as e-healthcare, transportation, agriculture, stock market, etc. Advanced analytics is a mixture of machine learning, artificial intelligence, graphs, text mining, data mining, semantic analysis. It is an approach to data analysis. Beyond the traditional

business intelligence, it is a semi and autonomous analysis of data by using different techniques and tools. However, deep learning and data analysis both are high centers of data science. Almost all the private and public organizations collect heavy amounts of data, i.e., domain-specific data. Many small/large companies are exploring large amounts of data for existing and future technology. Deep learning is also exploring large amounts of unsupervised data making it beneficial and effective for big data. Deep learning can be used to deal with all kinds of problems and challenges that include collecting unlabeled and uncategorized raw data, extracting complex patterns from a large amount of data, retrieving fast information, tagging data, etc. This

book contains 16 chapters on artificial intelligence, machine learning, deep learning, and their uses in many useful sectors like stock market prediction, a recommendation system for better service selection, e-healthcare, telemedicine, transportation. There are also chapters on innovations and future opportunities with fog computing/cloud computing and artificial intelligence. Audience Researchers in artificial intelligence, big data, computer science, and electronic engineering, as well as industry engineers in healthcare, telemedicine, transportation, and the financial sector. The book will also be a great source for software engineers and advanced students who are beginners in the field of advanced analytics in

deep learning.
